3D Printing & CAD Portfolio

FDM 3D printing | Bambu Lab H2C | Fusion 360 | Reverse engineering practice

Prague, Czech Republic | +420 607 577 776 | yaskasergeevna@gmail.com

Selected personal and customer projects. Almost one year of hands-on FDM printing experience with PLA, PETG and ABS.

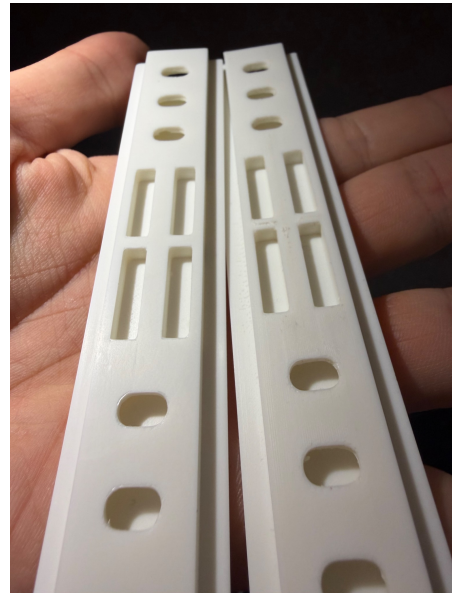

Functional replacement parts

From an existing physical part to a printed replacement

Bicycle cable mounting part

Recreated from an original physical part and produced with FDM printing. This project is an example of practical part reconstruction and printing a functional replacement.

Built-in refrigerator door parts

Replacement parts made after the original component was broken. The parts were modelled and 3D printed for a customer.

Tools: Fusion 360 (basic), slicer software, Bambu Lab H2C, FDM printing.

Custom QR & NFC payment stand

A functional multi-colour print for a beauty salon

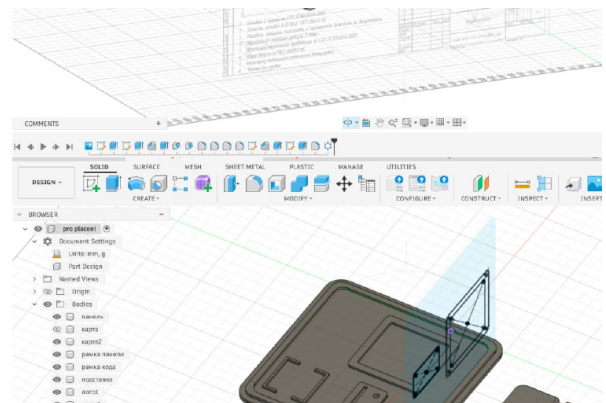

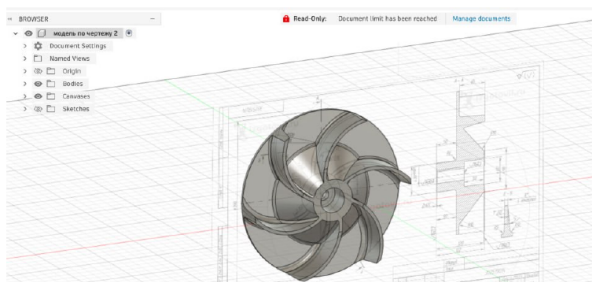

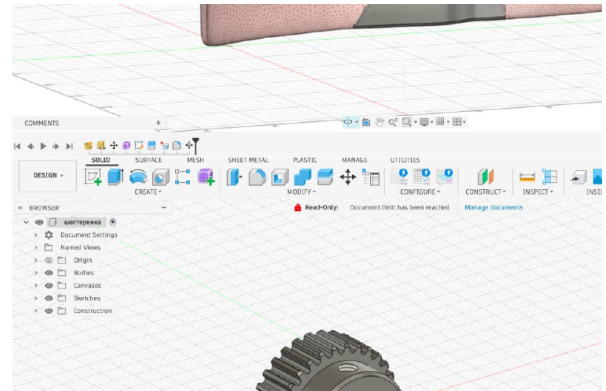

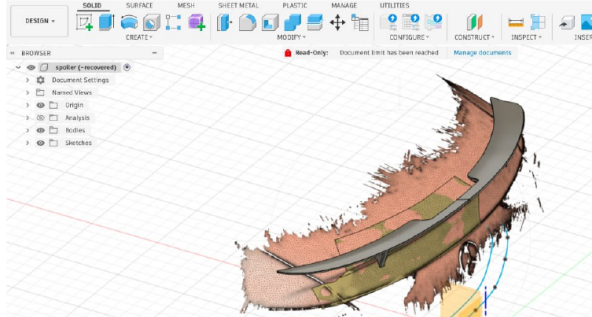

Custom 3D printed stand with a working QR code and an integrated NFC chip. The project combines a physical printed object with functional digital payment/contact elements. I also have experience printing multi-part customer models and assembling them after printing.

Process: model preparation / customization, multi-colour FDM printing, assembly and functional check. **Post-processing:** assembly and gluing of separately printed components when a model is made in multiple parts.

Fusion 360 & reverse engineering practice

Selected CAD work from my training and personal practice

Examples include work with scanned/mesh geometry, mechanical modelling, modelling from reference drawings, and simple parametric parts. These are training/personal projects rather than commercial engineering work.

Fusion 360: Sketch, Extrude, Revolve and basic 3D modelling. Completed a reverse engineering course using Fusion 360.

Additional FDM printing & assembly

Everyday printer use, small details and multi-part models

Small prints are included as an additional example of everyday FDM printer use and handling fine features. For larger or multi-part customer models, I have also printed components separately and assembled and glued them after printing.

Equipment: Bambu Lab H2C

Materials used: PLA, PETG, ABS

Experience: almost 1 year of hands-on 3D printing
